PROFILE SUMMARY

- Unity Game Developer with 1.2 years of experience building and optimizing scalable 2D and 3D games using Unity and C#. Architect and implement server-authoritative multiplayer systems using Photon, Mirror, and Unity Netcode.
- Design gameplay systems, develop AI using Minimax algorithms, integrate REST APIs, and optimize runtime performance through object pooling and efficient system design. Deliver production-ready, scalable, and maintainable game solutions.

EDUCATION

IGNOU

Bachelor's of Computer Application - Pursuing

CORE COMPETENCIES

- Unity 2D & Unity 3D Development
- C# Programming
- Multiplayer Networking (Photon, Mirror, Unity Netcode)
- Server-Authoritative Architecture REST API Integration (Newtonsoft JSON)
- Object Pooling & Performance Optimization
- AI Systems (Minimax, Heuristic-Based AI)
- ScriptableObjects & Coroutines
- Unity UI & DOTween
- Data Structures & OOPs
- Git & GitHub

CERTIFICATION

DIPLOMA IN UNITY GAME DEVELOPMENT

Big Boy School of Gaming - Kochi

Apr 2024 - Dec 2024

- Completed a diploma in Unity Game Development, gaining hands-on experience in Unity 2D, Unity 3D, and C# programming.
- Developed practical skills in creating immersive games and interactive applications within a few intensive months.

KEY ACHIEVEMENTS

- Mentored junior Unity developers, improving code quality and architectural consistency across projects.
- Led development efforts including feature planning, sprint coordination, and technical decision-making.
- Diagnosed and resolved complex Unity issues such as UI optimization bottlenecks, memory performance challenges, and asset GUID conflicts in version-controlled environments.
- Conducted R&D for upcoming features, evaluating technical feasibility and defining scalable implementation strategies.
- Implemented constraint-based state validation and filtering algorithms to eliminate unsolvable possibilities during random generation in strategy-based game systems.

PROFESSIONAL EXPERIENCE

ASSOCIATE GAME DEVELOPER - UNITY ENGINE

Infocom Software Pvt. Ltd | May 2025 - Present

- Developed and maintained 2D and 3D games using Unity and C#.
- Implemented multiplayer systems using Photon with real-time player synchronization.
- Designed server-authoritative architecture to prevent desynchronization and cheating.
- Integrated REST APIs using Newtonsoft JSON for player progression and backend communication.
- Improved runtime performance using object pooling and optimized update cycles..
- Used ScriptableObjects for scalable and reusable game configuration.
- Implemented UI animations and feedback systems using DOTween.

PROJECTS

Merge Fruit (Physics Puzzle Game)

Unity | Mobile Casual Game | Published on Play Store

- Developed a 2D fruit merge puzzle game in Unity featuring physics-based gameplay where players combine matching fruits to create higher-level fruits and achieve high scores.
- Designed and implemented smooth drag-and-drop mechanics, collision-based merging logic, and progressive difficulty balancing to improve player engagement and retention.
- Built responsive UI systems including score tracking, combo effects, game-over detection, and animated feedback for an engaging mobile gameplay experience.
- Optimized mobile performance using object pooling, lightweight physics interactions, and efficient sprite management to ensure smooth gameplay across Android devices.

Donkey Master – Multiplayer Card Game

- Developed Donkey Master, a real-time multiplayer 2D card game in Unity inspired by the traditional Kazhutha Kali gameplay.
- Implemented online multiplayer systems including room creation, player synchronization, card dealing, and turn-based gameplay using Photon/Firebase networking.
- Created dynamic card shuffle and distribution mechanics with smooth animations and responsive UI for mobile platforms.
- Designed gameplay systems for winner/loser detection, player turns, and match flow management to ensure engaging multiplayer experiences.

Solitaire Collection

Developed a 2D Solitaire Collection Game in Unity featuring multiple popular card game modes including TriPeaks, Pyramid, FreeCell, Spider Solitaire, and Klondike Solitaire.

Implemented complete card systems including deck generation, shuffling, drag-and-drop controls, auto card movement, undo functionality, and win detection. Designed fully solvable game generation systems using seed-based algorithms with multiple difficulty levels for balanced and replayable gameplay.
